

PROJECT CHARTER	
Project Name	Ecosystem Discovery Application
Date Produced	27 January 2026
Project Goals	The purpose of this project is to educate children in Grades 2–3 (approximately ages 7–8) about freshwater ecosystems. The application introduces freshwater animals commonly found in Saskatchewan or similar North American freshwater environments, explains basic conservation concepts, and demonstrates how human actions can both negatively and positively impact these ecosystems. The project encourages young learners to understand practical ways they can help keep freshwater environments healthy and livable for the animals that depend on them.
Project Objectives	• Design a single freshwater ecosystem to serve as the setting for the application • Create six to eight freshwater animal designs • Research and present basic information about each animal, including habitat, diet, and the impact of human activities • Allow users to discover animals through simple interactive exploration and click-based discovery • Display collected animals in a visual “sticker book” • Present age-appropriate educational facts written at an approximate Grade 2–3 reading level • Include one event that demonstrates a negative impact on animal populations • Include one simple interaction that illustrates how positive human actions can help restore ecosystem health
Project Budget	The team does not intend to spend any money on the creation of this project. Therefore, the project will be completed without financial cost, using freely available tools and development resources.
Project Sponsor	Dr. Tim Maciag, ENSE 281 instructor
Project Manager	Rayansh Chowatia

Additional Key Project Stakeholders
--

[The names of key stakeholders that are known at this point in the project, including their job title or project role]

Overall Project Milestones

Dates

[A list of the key milestones that are known at this point in the project] [Milestone dates]
--

Project Initialization: • Pitch presentation • Business case document • Charter document	Jan 30, 2026
Possible “work-in-progress” meeting	Feb 25, 2026
Project Prerequisites and System Design: • Stakeholder register • Project roles and responsibilities document • Project scope document • GitHub Project Board • Defined and rationalized Minimum Viable Product (MVP) features • Diagrams that demonstrate how the team is using MVC and domain-driven design • Lo-fidelity and/or high -fidelity prototypes • User questionnaire • Project presentation • Self-reflection	March 4, 2026
Project progress scrum/check-in: • Project status report • Project presentation • Self-reflection	March 18, 2026
Project delivery and closing: • Project MVP code • GitHub Project Board • Project installation requirements and instructions • Final project vlog demonstration • Final project report • Final project presentation • Self-reflection	April 8, 2026
Overall Project Risks	
[A list of the overall risks that are known at this point in the project]	

- There is a risk that the project may not be completed within the planned timeline due to academic workload and limited development time.
- The team may need to learn and use tools or technologies that have not been previously covered in class, which could increase the time required for development.
- There is a risk that the intended audience of elementary school children may not find the application sufficiently engaging if the design and interactions are not appealing.
- Some team members have limited experience in visual or artistic design, which may impact the overall visual quality of the application.
- There is a risk that some educational information about freshwater animals may be incomplete or inaccurate if not carefully researched and validated.
- There is a risk that the project scope may expand beyond a manageable level if additional ecosystems, animals, or complex animations are introduced.
- There is a risk that the interaction flow (right/wrong answer behavior and sticker unlock logic) may not be clearly defined, which could impact usability and user understanding.
