Activity 3

PROJECT IDEA/BACKGROUND

The application is designed as an interactive ecosystem where users can visually explore different ecological zones such as sky, shoreline, water surface, and underwater environments.

Users will be able to:

- Interact with animals through simple click-based actions
- View educational information about each animal
- Track their progress through a sticker collection system

The system emphasizes child-friendly design, including clear navigation, large interactive elements, and visually engaging content.

PROJECT STATUS

Current Status: Yellow

The project is currently in a Yellow status, indicating that significant progress has been made, but key functional features are still under development.

The user interface and layout of the system have been successfully implemented. However, interactive features such as animations, clickable elements, and dynamic updates are still being developed and integrated.

WORK COMPLETED

- During this development phase, the team has successfully implemented the core visual structure of the application.
- Completed components include:
 - A homepage with navigation and a call-to-action
 - Feature cards representing key functionalities
 - A structured ecosystem screen layout
 - A consistent footer and overall UI design
- Improved GitHub repository structure based on feedback

CHALLENGES / ISSUES

- The team encountered several challenges during this phase of development.
- One of the main challenges is transitioning from a static user interface to an interactive system. Implementing animations such as water movement and animal behavior while maintaining performance requires careful design and optimization.
- Additionally, managing multiple features simultaneously requires effective time management and prioritization.

NEXT STEPS

- In the next development phase, the team will focus on implementing interactivity and completing core system functionality.
- Planned tasks include:
 - Adding animals to the ecosystem
 - Enabling click-based interactions
 - Developing animal information cards
 - Implementing the sticker collection system
 - Adding animation elements such as water and movement

REFLECTION – EXPERIENCE

This activity provided valuable experience in developing a real-world interactive system from design to implementation. The team particularly enjoyed working on the user interface and seeing the design evolve into a functional application. At the same time, implementing interactive features highlighted the complexity involved in transitioning from static designs to dynamic systems.

REFLECTION – TEAM ACHIEVEMENT

- The team is most proud of successfully implementing a consistent and visually engaging user interface.
- The ecosystem screen represents a key achievement, as it serves as the foundation for all future interactive features.
- Improvements to the GitHub repository structure also enhanced collaboration and project organization.

REFLECTION – LEARNING

- Through this activity, the team developed a strong understanding of structured system design using MVC architecture.
- We also gained practical experience in collaborative development using GitHub, including version control and project organization.
- Additionally, we improved our ability to translate design concepts into functional components.

REFLECTION – FUTURE USE

- The team will apply structured development practices, including MVC architecture and version control, in future projects.
- Greater emphasis will be placed on early planning for interactive features and system behavior.
- These improvements will support more efficient development and better project outcomes.

REFLECTION – HELP NEEDED

- The team would benefit from additional guidance in implementing interactive features within web-based systems.
- Support in animation techniques, particularly for natural movements such as water and object motion, would improve the application.
- Further assistance in optimizing performance while adding dynamic elements would also be valuable.

CONCLUSION

The project has successfully established a strong visual and structural foundation for the Ecosystem Discovery Application.

Key user interface components, including the homepage, feature navigation, and ecosystem screen, have been implemented and integrated into a consistent design.

The team is now transitioning into the development of core interactive features, including animal interactions, information display, and progress tracking.

Overall, the project is progressing steadily and is on track to deliver a functional Minimum Viable Product (MVP).

Thank you!
