

PROJECT SCOPE STATEMENT	
Project Name	Ecosystem Discovery Application
Project Deliverables	Detailed Description
Freshwater Ecosystem Interface	A web-based interactive scene representing a single freshwater ecosystem. The interface will display 6-8 animals placed within the environment. Users can click on animals to interact with them. The design will be child-friendly, with large buttons, bright visuals, and simple navigation.
Animal Information Cards	A pop-up information panel that appears when an animal is selected. Each card will display: • Animal name • Cartoon-style image • Short, age-appropriate educational description • Basic information (habitat, diet, simple conservation fact) All content will be written for approximately Grade 2–3 reading level.
Sticker-Book Collection Page	A digital “sticker-book” panel displayed alongside the ecosystem scene. • Discovered animals appear as unlocked stickers. • Undiscovered animals appear as locked placeholders or silhouettes. • The system displays overall progress (e.g., “3 of 6 animals discovered”). • The sticker book updates immediately after discovery.
Database-Backed Model	A structured data model that stores: • Animal data (name, habitat, diet, conservation note, image reference) • Discovery status (locked/unlocked) • Progress information The application will retrieve and update data as users interact with the ecosystem. Data persistence will support complete discovery flow.
MVC Architecture implementation	The system will follow the Model–View–Controller architecture: • Model: Manages animal data and discovery state • View: Displays ecosystem scene, sticker book, and information cards • Controller: Handles user interactions, click events, unlocking logic, and data updates

Functional MVP Application	A fully working web-based application demonstrating the complete discovery loop: Ecosystem exploration → Animal selection → Information display → Sticker unlock → Progress update → Data persistence The MVP will include: • At least 6 animals • One negative ecosystem impact example • One positive restoration interaction
Project Documentation	Formal documentation including: • Stakeholder Register • Project Requirements Document • Updated Scope Statement • UML-style diagrams (process, data, and class diagrams) • MVP plan and task breakdown
Version Control Repository	A structured GitHub repository containing: • All source code • Activity-based documentation folders • Organized README • GitHub Projects (Kanban board) for task tracking
Project Exclusions	
The following items are explicitly out of scope: • Multiplayer functionality • User accounts or authentication systems • Advanced physics simulations or 3D game engine • Multiple ecosystems or biomes • More than 8 animals • Complex scoring or competitive game mechanics
